<<\DOC\_END

This sample hook safeguards topic branches that have been published from being rewound.

The workflow assumed here is:

- \* Once a topic branch forks from "master", "master" is never merged into it again (either directly or indirectly).
- \* Once a topic branch is fully cooked and merged into "master", it is deleted. If you need to build on top of it to correct earlier mistakes, a new topic branch is created by forking at the tip of the "master". This is not strictly necessary, but it makes it easier to keep your history simple.

\* Whenever you need to test or publish your changes to topic branches, merge them into "next" branch.

The script, being an example, hardcodes the publish branch name to be "next", but it is trivial to make it configurable via \$GIT\_DIR/config mechanism.

With this workflow, you would want to know:

(1) ... if a topic branch has ever been merged to "next". Young topic branches can have stupid mistakes you would rather clean up before publishing, and things that have not been merged into other branches can be easily rebased without affecting other people. But once it is published, you would not want to rewind it.

(2) ... if a topic branch has been fully merged to "master".

Then you can delete it. More importantly, you should not build on top of it -- other people may already want to change things related to the topic as patches against your "master", so if you need further changes, it is better to fork the topic (perhaps with the same name) afresh from the tip of "master".

Let's look at this example:

o---o---o---o---o---o---o---o---o "next"

```

/   /   /   /
/  a---a---b A  /   /
/ /           /   /
      / /  c---c---c---c B   /
      / / /           \   /
      / / /  b---b C   \   /
      / / / /           \   /
---o---o---o---o---o---o---o---o---o---o "master"

```

A, B and C are topic branches.

- \* A has one fix since it was merged up to "next".
- \* B has finished. It has been fully merged up to "master" and "next",  
and is ready to be deleted.
- \* C has not merged to "next" at all.

We would want to allow C to be rebased, refuse A, and encourage B to be deleted.

To compute (1):

```

git rev-list ^master ^topic next
git rev-list ^master      next

```

if these match, topic has not merged in next at all.

To compute (2):

```
git rev-list master..topic
```

if this is empty, it is fully merged to "master".

# fi

----- Contents of push-to-checkout.sample -----

#!/bin/sh

# An example hook script to update a checked-out tree on a git push.

#

# This hook is invoked by git-receive-pack(1) when it reacts to git

# push and updates reference(s) in its repository, and when the push

# tries to update the branch that is currently checked out and the

# receive.denyCurrentBranch configuration variable is set to

# updateInstead.

#

# By default, such a push is refused if the working tree and the index

# of the remote repository has any difference from the currently

# checked out commit; when both the working tree and the index match

# the current commit, they are updated to match the newly pushed tip

# of the branch. This hook is to be used to override the default

# behaviour; however the code below reimplements the default behaviour

# as a starting point for convenient modification.

#

# The hook receives the commit with which the tip of the current

# branch is going to be updated:

commit=\$1

# It can exit with a non-zero status to refuse the push (when it does

# so, it must not modify the index or the working tree).

```
die () {  
    echo >&2 "$*"   
    exit 1  
}
```

# Or it can make any necessary changes to the working tree and to the  
# index to bring them to the desired state when the tip of the current  
# branch is updated to the new commit, and exit with a zero status.

#

# For example, the hook can simply run `git read-tree -u -m HEAD "$1"`

# in order to emulate `git fetch` that is run in the reverse direction

# with `git push`, as the two-tree form of `git read-tree -u -m` is

# essentially the same as `git switch` or `git checkout` that switches

# branches while keeping the local changes in the working tree that do

# not interfere with the difference between the branches.

# The below is a more-or-less exact translation to shell of the C code

# for the default behaviour for git's push-to-checkout hook defined in

# the `push_to_deploy()` function in `builtin/receive-pack.c`.

#

# Note that the hook will be executed from the repository directory,

# not from the working tree, so if you want to perform operations on

# the working tree, you will have to adapt your code accordingly, e.g.

# by adding `"cd .."` or using relative paths.

```
if ! git update-index -q --ignore-submodules --refresh

DiscordBotProject\_CISC699 - Project Overview

## Introduction

This project is a Discord bot designed to perform various tasks, including tracking product prices, checking availability, logging into websites, and exporting data.

The bot interacts with users via commands sent through Discord and responds based on the requested use case.

The project follows a clear structure, adhering to software engineering best practices, and separates the logic into Boundary, Control, and Entity objects to manage the flow of data and logic.

Scroll all the way down for project outline

## Objects and Their Roles

### Entity Objects

Entity objects represent the core business data and operations related to those entities. They store data and perform business logic related to that data. They do not interact directly with the user.

**ProductEntity:** Represents product information such as price and features. It handles product-related data (e.g., retrieving the current price).

**DateEntity:** Handles date and availability logic for booking or checking availability of services.

**AccountEntity:** Manages user login credentials for websites like BestBuy or eBay.

**TrackingHistoryEntity:** Stores and tracks historical data on product prices. Helps to compare past prices with current ones.

**BrowserEntity:** Manages the state of the browser (e.g., if the browser is running, whether it's in

incognito mode, etc.).

NotificationEntity: Handles user preferences for receiving notifications, such as when prices change or product availability is updated.

## Control Objects

Control objects are responsible for handling the logic of each use case. They interact with entity objects to manage data and handle business rules. Control objects execute the steps required to fulfill a use case.

HelpControl: Provides a list of commands available to the user.

ChatControl: Handles basic user interaction, such as greetings and responses to basic phrases like "hi" or "hello."

LoginControl: Manages the process of logging into a website, including retrieving login credentials from the database and passing them to the browser.

BrowserControl: Manages the launch and setup of the browser, including handling incognito mode and configuring the browser.

CloseBrowserControl: Handles the logic for closing the browser when requested by the user.

NavigationControl: Manages the process of navigating to a specific URL in the browser.

ProductTrackingControl: Manages the tracking of a product's price over time, scheduling regular price checks.

ProductControl: Checks the current price of a product and retrieves relevant product data.

AvailabilityControl: Handles checking the availability of a product or service based on user-provided dates.

StopTrackingControl: Stops the tracking process for a product or service.

NotificationControl: Monitors for changes in tracked products and sends notifications when a price or availability change occurs.

DataExtractionControl: Manages the extraction of tracking data, exporting it to Excel or HTML files.

BotControl: Manages the overall lifecycle of the Discord bot, including starting, stopping, and managing the registration of commands.

## Boundary Objects

Boundary objects serve as the bridge between the user (or external actor) and the system. They collect data from the user and forward it to the appropriate control object. Boundary objects are responsible for interacting with the actor but not for executing business logic.

HelpBoundary: Collects the user's help request and forwards it to HelpControl.

ChatBoundary: Receives chat commands from the user and forwards them to ChatControl.

LoginBoundary: Collects login credentials from the user and forwards them to LoginControl.

BrowserBoundary: Receives commands to launch the browser and forwards them to BrowserControl.

CloseBrowserBoundary: Receives the user's request to close the browser and forwards it to CloseBrowserControl.

NavigationBoundary: Receives URL input from the user and forwards it to NavigationControl.

ProductTrackingBoundary: Collects the user's request to track a product and forwards it to ProductTrackingControl.

ProductBoundary: Receives the user's request to check a product price and forwards it to ProductControl.

AvailabilityBoundary: Collects the user's availability check request and forwards it to AvailabilityControl.

StopTrackingBoundary: Receives the user's request to stop tracking a product and forwards it to StopTrackingControl.

NotificationBoundary: Collects user preferences for receiving notifications and forwards them to NotificationControl.

DataExtractionBoundary: Collects the user's request to export data and forwards it to DataExtractionControl.

StopBoundary: Receives the request to stop the bot and forwards it to BotControl.

## Capabilities

Here's what the bot can do:

### 1. !project\_help

Description: Provides a list of available commands the user can issue.

Objects Involved:

Boundary: HelpBoundary

Control: HelpControl

Interaction: HelpBoundary collects the user's help request and forwards it to HelpControl, which responds with the list of commands.

### 2. !chat\_with\_bot

Description: Responds to simple greetings (e.g., "hi", "hello") and provides a welcome message.

Objects Involved:

Boundary: ChatBoundary

Control: ChatControl

Interaction: ChatBoundary collects chat input and forwards it to ChatControl, which sends back a predefined response.

### 3. !login\_to\_website

Description: Logs into a website using stored credentials (e.g., BestBuy).

Objects Involved:

Boundary: LoginBoundary

Control: LoginControl, BrowserControl, NavigationControl

Entity: AccountEntity

Interaction:

LoginBoundary collects login credentials and forwards them to LoginControl.

LoginControl works with BrowserControl to launch the browser.

NavigationControl navigates to the website's login page.

AccountEntity retrieves the stored credentials from the database and logs the user in.

#### 4. !launch\_browser

Description: Launches the browser, optionally in incognito mode.

Objects Involved:

Boundary: BrowserBoundary

Control: BrowserControl

Entity: BrowserEntity

Interaction: BrowserBoundary collects the user's request to launch the browser and sends it to BrowserControl. BrowserControl uses BrowserEntity to configure and launch the browser.

#### 5. !close\_browser

Description: Closes the currently open browser session.

Objects Involved:

Boundary: CloseBrowserBoundary

Control: CloseBrowserControl

Entity: BrowserEntity

Interaction: CloseBrowserBoundary forwards the user's request to CloseBrowserControl, which then tells BrowserEntity to close the browser session.

#### 6. !navigate\_to\_website

Description: Navigates to a specific website URL in the browser.

Objects Involved:

Boundary: NavigationBoundary

Control: NavigationControl

Entity: BrowserEntity

Interaction: NavigationBoundary collects the URL input from the user and forwards it to NavigationControl. NavigationControl instructs BrowserEntity to navigate to the specified URL.

#### 7. !track\_price

Description: Tracks the price of a product over time and sends notifications if the price changes.

Objects Involved:

Boundary: ProductTrackingBoundary

Control: ProductTrackingControl, ProductControl, NotificationControl

Entity: ProductEntity, TrackingHistoryEntity, NotificationEntity

Interaction:

ProductTrackingBoundary collects the product URL from the user.

ProductTrackingControl initiates price tracking and uses ProductControl to fetch the current price.

The current price is stored in TrackingHistoryEntity.

If there's a price change, NotificationControl sends an alert via NotificationEntity.

8. !check\_price

Description: Manually checks the current price of a product.

Objects Involved:

Boundary: ProductBoundary

Control: ProductControl

Entity: ProductEntity

Interaction: ProductBoundary collects the product information from the user, and ProductControl retrieves the current price using ProductEntity.

9. !check\_availability

Description: Checks the availability of a product or service on a specific date.

Objects Involved:

Boundary: AvailabilityBoundary

Control: AvailabilityControl

Entity: DateEntity

Interaction: AvailabilityBoundary collects the date and product/service details. AvailabilityControl checks the availability via DateEntity.

10. !stop\_tracking

Description: Stops tracking the price or availability of a product.

Objects Involved:

Boundary: StopTrackingBoundary

Control: StopTrackingControl

Entity: TrackingHistoryEntity

Interaction: StopTrackingBoundary collects the stop request from the user. StopTrackingControl stops the tracking and updates TrackingHistoryEntity.

#### 11. !receive\_notifications

Description: Sends notifications when there's a change in price or availability for tracked products/services.

Objects Involved:

Boundary: NotificationBoundary

Control: NotificationControl

Entity: NotificationEntity, TrackingHistoryEntity

Interaction: NotificationBoundary collects the user's preferences for receiving notifications. NotificationControl monitors for changes and uses NotificationEntity to send alerts when changes occur.

#### 12. !extract\_data

Description: Extracts the tracked product data and exports it to Excel or HTML format.

Objects Involved:

Boundary: DataExtractionBoundary

Control: DataExtractionControl

Entity: TrackingHistoryEntity

Utilities: ExcelUtils, HTMLUtils

Interaction: DataExtractionBoundary collects the user's request for data extraction. DataExtractionControl retrieves data from TrackingHistoryEntity and uses ExcelUtils or HTMLUtils to export the data to the desired format.

### 13. !stop

Description: Stops the Discord bot from running.

Objects Involved:

Boundary: StopBoundary

Control: BotControl

Interaction: StopBoundary collects the stop command from the user and forwards it to BotControl, which gracefully stops the bot.

<<\DOC_END
```

This sample hook safeguards topic branches that have been published from being rewound.

The workflow assumed here is:

- \* Once a topic branch forks from "master", "master" is never merged into it again (either directly or indirectly).
- \* Once a topic branch is fully cooked and merged into "master", it is deleted. If you need to build on top of it to correct earlier mistakes, a new topic branch is created by forking at the tip of the "master". This is not strictly necessary, but it makes it easier to keep your history simple.
- \* Whenever you need to test or publish your changes to topic branches, merge them into "next" branch.

The script, being an example, hardcodes the publish branch name to be "next", but it is trivial to make it configurable via \$GIT\_DIR/config mechanism.

With this workflow, you would want to know:

(1) ... if a topic branch has ever been merged to "next". Young topic branches can have stupid mistakes you would rather clean up before publishing, and things that have not been merged into other branches can be easily rebased without affecting other people. But once it is published, you would not want to rewind it.

(2) ... if a topic branch has been fully merged to "master".

Then you can delete it. More importantly, you should not build on top of it -- other people may already want to change things related to the topic as patches against your "master", so if you need further changes, it is better to fork the topic (perhaps with the same name) afresh from the tip of "master".

Let's look at this example:

```
o---o---o---o---o---o---o---o---o "next"
/   /       /       /
/ a---a---b A   /       /
```

```

/ /      /      /
      / /  c---c---c---c B      /
      / / /      \      /
      / / /  b---b C   \      /
      / / / /      \      /
---o---o---o---o---o---o---o---o---o---o "master"

```

A, B and C are topic branches.

- \* A has one fix since it was merged up to "next".
- \* B has finished. It has been fully merged up to "master" and "next",  
and is ready to be deleted.
- \* C has not merged to "next" at all.

We would want to allow C to be rebased, refuse A, and encourage  
B to be deleted.

To compute (1):

```

git rev-list ^master ^topic next
git rev-list ^master      next

```

if these match, topic has not merged in next at all.

To compute (2):

```
git rev-list master..topic
```

if this is empty, it is fully merged to "master".

----- Contents of push-to-checkout.sample -----

```
#!/bin/sh
```

```
# An example hook script to update a checked-out tree on a git push.
```

```
#
```

```
# This hook is invoked by git-receive-pack(1) when it reacts to git
```

```
# push and updates reference(s) in its repository, and when the push
```

```
# tries to update the branch that is currently checked out and the
```

```
# receive.denyCurrentBranch configuration variable is set to
```

```
# updateInstead.
```

```
#
```

```
# By default, such a push is refused if the working tree and the index
```

```
# of the remote repository has any difference from the currently
```

```
# checked out commit; when both the working tree and the index match
```

```
# the current commit, they are updated to match the newly pushed tip
```

```
# of the branch. This hook is to be used to override the default
```

```
# behaviour; however the code below reimplements the default behaviour
```

```
# as a starting point for convenient modification.
```

```
#
```

```
# The hook receives the commit with which the tip of the current
```

```
# branch is going to be updated:
```

```
commit=$1
```

```
# It can exit with a non-zero status to refuse the push (when it does
```

```
# so, it must not modify the index or the working tree).
```

```
die () {
```

```
echo >&2 "$@"
```

```
exit 1
```

```
}
```

```
# Or it can make any necessary changes to the working tree and to the  
# index to bring them to the desired state when the tip of the current  
# branch is updated to the new commit, and exit with a zero status.
```

```
#
```

```
# For example, the hook can simply run git read-tree -u -m HEAD "$1"
```

```
# in order to emulate git fetch that is run in the reverse direction
```

```
# with git push, as the two-tree form of git read-tree -u -m is
```

```
# essentially the same as git switch or git checkout that switches
```

```
# branches while keeping the local changes in the working tree that do
```

```
# not interfere with the difference between the branches.
```

```
# The below is a more-or-less exact translation to shell of the C code
```

```
# for the default behaviour for git's push-to-checkout hook defined in
```

```
# the push_to_deploy() function in builtin/receive-pack.c.
```

```
#
```

```
# Note that the hook will be executed from the repository directory,
```

```
# not from the working tree, so if you want to perform operations on
```

```
# the working tree, you will have to adapt your code accordingly, e.g.
```

```
# by adding "cd .." or using relative paths.

DiscordBotProject\_CISC699 - Project Overview

Introduction

This project is a Discord bot designed to perform various tasks, including tracking product prices, checking availability, logging into websites, and exporting data.

The bot interacts with users via commands sent through Discord and responds based on the requested use case.

The project follows a clear structure, adhering to software engineering best practices, and separates the logic into Boundary, Control, and Entity objects to manage the flow of data and logic.

Scroll all the way down for project outline

## Objects and Their Roles

### Entity Objects

Entity objects represent the core business data and operations related to those entities. They store data and perform business logic related to that data. They do not interact directly with the user.

**ProductEntity:** Represents product information such as price and features. It handles product-related data (e.g., retrieving the current price).

**DateEntity:** Handles date and availability logic for booking or checking availability of services.

**AccountEntity:** Manages user login credentials for websites like BestBuy or eBay.

**TrackingHistoryEntity:** Stores and tracks historical data on product prices. Helps to compare past prices with current ones.

**BrowserEntity:** Manages the state of the browser (e.g., if the browser is running, whether it's in incognito mode, etc.).

NotificationEntity: Handles user preferences for receiving notifications, such as when prices change or product availability is updated.

## Control Objects

Control objects are responsible for handling the logic of each use case. They interact with entity objects to manage data and handle business rules. Control objects execute the steps required to fulfill a use case.

HelpControl: Provides a list of commands available to the user.

ChatControl: Handles basic user interaction, such as greetings and responses to basic phrases like "hi" or "hello."

LoginControl: Manages the process of logging into a website, including retrieving login credentials from the database and passing them to the browser.

BrowserControl: Manages the launch and setup of the browser, including handling incognito mode and configuring the browser.

CloseBrowserControl: Handles the logic for closing the browser when requested by the user.

NavigationControl: Manages the process of navigating to a specific URL in the browser.

ProductTrackingControl: Manages the tracking of a product's price over time, scheduling regular price checks.

ProductControl: Checks the current price of a product and retrieves relevant product data.

AvailabilityControl: Handles checking the availability of a product or service based on user-provided dates.

StopTrackingControl: Stops the tracking process for a product or service.

NotificationControl: Monitors for changes in tracked products and sends notifications when a price or availability change occurs.

DataExtractionControl: Manages the extraction of tracking data, exporting it to Excel or HTML files.

BotControl: Manages the overall lifecycle of the Discord bot, including starting, stopping, and managing the registration of commands.

## Boundary Objects

Boundary objects serve as the bridge between the user (or external actor) and the system. They collect data from the user and forward it to the appropriate control object. Boundary objects are responsible for interacting with the actor but not for executing business logic.

HelpBoundary: Collects the user's help request and forwards it to HelpControl.

ChatBoundary: Receives chat commands from the user and forwards them to ChatControl.

LoginBoundary: Collects login credentials from the user and forwards them to LoginControl.

BrowserBoundary: Receives commands to launch the browser and forwards them to BrowserControl.

CloseBrowserBoundary: Receives the user's request to close the browser and forwards it to

CloseBrowserControl.

NavigationBoundary: Receives URL input from the user and forwards it to NavigationControl.

ProductTrackingBoundary: Collects the user's request to track a product and forwards it to ProductTrackingControl.

ProductBoundary: Receives the user's request to check a product price and forwards it to ProductControl.

AvailabilityBoundary: Collects the user's availability check request and forwards it to AvailabilityControl.

StopTrackingBoundary: Receives the user's request to stop tracking a product and forwards it to StopTrackingControl.

NotificationBoundary: Collects user preferences for receiving notifications and forwards them to NotificationControl.

DataExtractionBoundary: Collects the user's request to export data and forwards it to DataExtractionControl.

StopBoundary: Receives the request to stop the bot and forwards it to BotControl.

Capabilities

Here's what the bot can do:

### 1. !project\_help

Description: Provides a list of available commands the user can issue.

Objects Involved:

Boundary: HelpBoundary

Control: HelpControl

Interaction: HelpBoundary collects the user's help request and forwards it to HelpControl, which responds with the list of commands.

### 2. !chat\_with\_bot

Description: Responds to simple greetings (e.g., "hi", "hello") and provides a welcome message.

Objects Involved:

Boundary: ChatBoundary

Control: ChatControl

Interaction: ChatBoundary collects chat input and forwards it to ChatControl, which sends back a predefined response.

### 3. !login\_to\_website

Description: Logs into a website using stored credentials (e.g., BestBuy).

Objects Involved:

Boundary: LoginBoundary

Control: LoginControl, BrowserControl, NavigationControl

Entity: AccountEntity

Interaction:

LoginBoundary collects login credentials and forwards them to LoginControl.

LoginControl works with BrowserControl to launch the browser.

NavigationControl navigates to the website's login page.

AccountEntity retrieves the stored credentials from the database and logs the user in.

#### 4. !launch\_browser

Description: Launches the browser, optionally in incognito mode.

Objects Involved:

Boundary: BrowserBoundary

Control: BrowserControl

Entity: BrowserEntity

Interaction: BrowserBoundary collects the user's request to launch the browser and sends it to BrowserControl. BrowserControl uses BrowserEntity to configure and launch the browser.

#### 5. !close\_browser

Description: Closes the currently open browser session.

Objects Involved:

Boundary: CloseBrowserBoundary

Control: CloseBrowserControl

Entity: BrowserEntity

Interaction: CloseBrowserBoundary forwards the user's request to CloseBrowserControl, which then tells BrowserEntity to close the browser session.

#### 6. !navigate\_to\_website

Description: Navigates to a specific website URL in the browser.

Objects Involved:

Boundary: NavigationBoundary

Control: NavigationControl

Entity: BrowserEntity

Interaction: NavigationBoundary collects the URL input from the user and forwards it to NavigationControl. NavigationControl instructs BrowserEntity to navigate to the specified URL.

#### 7. !track\_price

Description: Tracks the price of a product over time and sends notifications if the price changes.

Objects Involved:

Boundary: ProductTrackingBoundary

Control: ProductTrackingControl, ProductControl, NotificationControl

Entity: ProductEntity, TrackingHistoryEntity, NotificationEntity

Interaction:

ProductTrackingBoundary collects the product URL from the user.

ProductTrackingControl initiates price tracking and uses ProductControl to fetch the current price.

The current price is stored in TrackingHistoryEntity.

If there's a price change, NotificationControl sends an alert via NotificationEntity.

8. !check\_price

Description: Manually checks the current price of a product.

Objects Involved:

Boundary: ProductBoundary

Control: ProductControl

Entity: ProductEntity

Interaction: ProductBoundary collects the product information from the user, and ProductControl retrieves the current price using ProductEntity.

9. !check\_availability

Description: Checks the availability of a product or service on a specific date.

Objects Involved:

Boundary: AvailabilityBoundary

Control: AvailabilityControl

Entity: DateEntity

Interaction: AvailabilityBoundary collects the date and product/service details. AvailabilityControl checks the availability via DateEntity.

10. !stop\_tracking

Description: Stops tracking the price or availability of a product.

Objects Involved:

Boundary: StopTrackingBoundary

Control: StopTrackingControl

Entity: TrackingHistoryEntity

Interaction: StopTrackingBoundary collects the stop request from the user. StopTrackingControl stops the tracking and updates TrackingHistoryEntity.

#### 11. !receive\_notifications

Description: Sends notifications when there's a change in price or availability for tracked products/services.

Objects Involved:

Boundary: NotificationBoundary

Control: NotificationControl

Entity: NotificationEntity, TrackingHistoryEntity

Interaction: NotificationBoundary collects the user's preferences for receiving notifications. NotificationControl monitors for changes and uses NotificationEntity to send alerts when changes occur.

#### 12. !extract\_data

Description: Extracts the tracked product data and exports it to Excel or HTML format.

Objects Involved:

Boundary: DataExtractionBoundary

Control: DataExtractionControl

Entity: TrackingHistoryEntity

Utilities: ExcelUtils, HTMLUtils

Interaction: DataExtractionBoundary collects the user's request for data extraction. DataExtractionControl retrieves data from TrackingHistoryEntity and uses ExcelUtils or HTMLUtils to export the data to the desired format.

#### 13. !stop

Description: Stops the Discord bot from running.

Objects Involved:

Boundary: StopBoundary

Control: BotControl

Interaction: StopBoundary collects the stop command from the user and forwards it to BotControl, which gracefully stops the bot.

```

This sample hook safeguards topic branches that have been published from being rewound.

The workflow assumed here is:

- \* Once a topic branch forks from "master", "master" is never merged into it again (either directly or indirectly).
- \* Once a topic branch is fully cooked and merged into "master", it is deleted. If you need to build on top of it to correct earlier mistakes, a new topic branch is created by forking at the tip of the "master". This is not strictly necessary, but it makes it easier to keep your history simple.
- \* Whenever you need to test or publish your changes to topic branches, merge them into "next" branch.

The script, being an example, hardcodes the publish branch name

to be "next", but it is trivial to make it configurable via \$GIT\_DIR/config mechanism.

With this workflow, you would want to know:

(1) ... if a topic branch has ever been merged to "next". Young topic branches can have stupid mistakes you would rather clean up before publishing, and things that have not been merged into other branches can be easily rebased without affecting other people. But once it is published, you would not want to rewind it.

(2) ... if a topic branch has been fully merged to "master".

Then you can delete it. More importantly, you should not build on top of it -- other people may already want to change things related to the topic as patches against your "master", so if you need further changes, it is better to fork the topic (perhaps with the same name) afresh from the tip of "master".

Let's look at this example:

```

      /  /  /      \      /
    /  /  /  b---b C  \      /
  /  /  /  /      \      /
---o---o---o---o---o---o---o---o---o---o "master"

```

A, B and C are topic branches.

- \* A has one fix since it was merged up to "next".
- \* B has finished. It has been fully merged up to "master" and "next",  
and is ready to be deleted.
- \* C has not merged to "next" at all.

We would want to allow C to be rebased, refuse A, and encourage B to be deleted.

To compute (1):

```

git rev-list ^master ^topic next
git rev-list ^master      next

```

if these match, topic has not merged in next at all.

To compute (2):

```
git rev-list master..topic
```

if this is empty, it is fully merged to "master".

#
```

```
# The hook receives the commit with which the tip of the current
```

```
# branch is going to be updated:
```

```
commit=$1
```

```
# It can exit with a non-zero status to refuse the push (when it does
```

```
# so, it must not modify the index or the working tree).
```

```
die () {
```

```
    echo >&2 "$@"
```

```
    exit 1
```

```
}
```

```
# Or it can make any necessary changes to the working tree and to the  
# index to bring them to the desired state when the tip of the current  
# branch is updated to the new commit, and exit with a zero status.
```

```
#
```

```
# For example, the hook can simply run git read-tree -u -m HEAD "$1"  
# in order to emulate git fetch that is run in the reverse direction  
# with git push, as the two-tree form of git read-tree -u -m is  
# essentially the same as git switch or git checkout that switches  
# branches while keeping the local changes in the working tree that do  
# not interfere with the difference between the branches.
```

```
# The below is a more-or-less exact translation to shell of the C code  
# for the default behaviour for git's push-to-checkout hook defined in  
# the push_to_deploy() function in builtin/receive-pack.c.
```

```
#
```

```
# Note that the hook will be executed from the repository directory,  
# not from the working tree, so if you want to perform operations on  
# the working tree, you will have to adapt your code accordingly, e.g.  
# by adding "cd .." or using relative paths.
```

```
if ! git update-index -q --ignore-submodules --refresh
```

```
then
```

```
    die "Up-to-date check failed"
```

```
fi
```

```
if ! git diff-files --quiet --ignore-submodules --  
  
then  
  
    die "Working directory has unstaged changes"  
  
fi
```

```
# This is a rough translation of:
```

```
#  
  
# head_has_history() ? "HEAD" : EMPTY_TREE_SHA1_HEX  
  
if git cat-file -e HEAD 2>/dev/null  
  
then  
  
    head=HEAD  
  
else  
  
    head=$(git hash-object -t tree --stdin </dev/null)  
  
fi
```

```

DiscordBotProject\_CISC699 - Project Overview

## Introduction

This project is a Discord bot designed to perform various tasks, including tracking product prices, checking availability, logging into websites, and exporting data.

The bot interacts with users via commands sent through Discord and responds based on the requested use case.

The project follows a clear structure, adhering to software engineering best practices, and separates the logic into Boundary, Control, and Entity objects to manage the flow of data and logic.

Scroll all the way down for project outline

## Objects and Their Roles

### Entity Objects

Entity objects represent the core business data and operations related to those entities. They store data and perform business logic related to that data. They do not interact directly with the user.

**ProductEntity:** Represents product information such as price and features. It handles product-related data (e.g., retrieving the current price).

**DateEntity:** Handles date and availability logic for booking or checking availability of services.

**AccountEntity:** Manages user login credentials for websites like BestBuy or eBay.

**TrackingHistoryEntity:** Stores and tracks historical data on product prices. Helps to compare past prices with current ones.

**BrowserEntity:** Manages the state of the browser (e.g., if the browser is running, whether it's in incognito mode, etc.).

**NotificationEntity:** Handles user preferences for receiving notifications, such as when prices change or product availability is updated.

## Control Objects

Control objects are responsible for handling the logic of each use case. They interact with entity objects to manage data and handle business rules. Control objects execute the steps required to fulfill a use case.

HelpControl: Provides a list of commands available to the user.

ChatControl: Handles basic user interaction, such as greetings and responses to basic phrases like "hi" or "hello."

LoginControl: Manages the process of logging into a website, including retrieving login credentials from the database and passing them to the browser.

BrowserControl: Manages the launch and setup of the browser, including handling incognito mode and configuring the browser.

CloseBrowserControl: Handles the logic for closing the browser when requested by the user.

NavigationControl: Manages the process of navigating to a specific URL in the browser.

ProductTrackingControl: Manages the tracking of a product's price over time, scheduling regular price checks.

ProductControl: Checks the current price of a product and retrieves relevant product data.

AvailabilityControl: Handles checking the availability of a product or service based on user-provided dates.

StopTrackingControl: Stops the tracking process for a product or service.

NotificationControl: Monitors for changes in tracked products and sends notifications when a price or availability change occurs.

DataExtractionControl: Manages the extraction of tracking data, exporting it to Excel or HTML files.

BotControl: Manages the overall lifecycle of the Discord bot, including starting, stopping, and managing the registration of commands.

## Boundary Objects

Boundary objects serve as the bridge between the user (or external actor) and the system. They collect data from the user and forward it to the appropriate control object. Boundary objects are responsible for interacting with the actor but not for executing business logic.

HelpBoundary: Collects the user's help request and forwards it to HelpControl.

ChatBoundary: Receives chat commands from the user and forwards them to ChatControl.

LoginBoundary: Collects login credentials from the user and forwards them to LoginControl.

BrowserBoundary: Receives commands to launch the browser and forwards them to BrowserControl.

CloseBrowserBoundary: Receives the user's request to close the browser and forwards it to CloseBrowserControl.

NavigationBoundary: Receives URL input from the user and forwards it to NavigationControl.

ProductTrackingBoundary: Collects the user's request to track a product and forwards it to ProductTrackingControl.

ProductBoundary: Receives the user's request to check a product price and forwards it to ProductControl.

AvailabilityBoundary: Collects the user's availability check request and forwards it to AvailabilityControl.

StopTrackingBoundary: Receives the user's request to stop tracking a product and forwards it to StopTrackingControl.

NotificationBoundary: Collects user preferences for receiving notifications and forwards them to NotificationControl.

DataExtractionBoundary: Collects the user's request to export data and forwards it to DataExtractionControl.

StopBoundary: Receives the request to stop the bot and forwards it to BotControl.

## Capabilities

Here's what the bot can do:

### 1. !project\_help

Description: Provides a list of available commands the user can issue.

Objects Involved:

Boundary: HelpBoundary

Control: HelpControl

Interaction: HelpBoundary collects the user's help request and forwards it to HelpControl, which responds with the list of commands.

### 2. !chat\_with\_bot

Description: Responds to simple greetings (e.g., "hi", "hello") and provides a welcome message.

Objects Involved:

Boundary: ChatBoundary

Control: ChatControl

Interaction: ChatBoundary collects chat input and forwards it to ChatControl, which sends back a predefined response.

### 3. !login\_to\_website

Description: Logs into a website using stored credentials (e.g., BestBuy).

Objects Involved:

Boundary: LoginBoundary

Control: LoginControl, BrowserControl, NavigationControl

Entity: AccountEntity

Interaction:

LoginBoundary collects login credentials and forwards them to LoginControl.

LoginControl works with BrowserControl to launch the browser.

NavigationControl navigates to the website's login page.

AccountEntity retrieves the stored credentials from the database and logs the user in.

### 4. !launch\_browser

Description: Launches the browser, optionally in incognito mode.

Objects Involved:

Boundary: BrowserBoundary

Control: BrowserControl

Entity: BrowserEntity

Interaction: BrowserBoundary collects the user's request to launch the browser and sends it to BrowserControl. BrowserControl uses BrowserEntity to configure and launch the browser.

5. !close\_browser

Description: Closes the currently open browser session.

Objects Involved:

Boundary: CloseBrowserBoundary

Control: CloseBrowserControl

Entity: BrowserEntity

Interaction: CloseBrowserBoundary forwards the user's request to CloseBrowserControl, which then tells BrowserEntity to close the browser session.

6. !navigate\_to\_website

Description: Navigates to a specific website URL in the browser.

Objects Involved:

Boundary: NavigationBoundary

Control: NavigationControl

Entity: BrowserEntity

Interaction: NavigationBoundary collects the URL input from the user and forwards it to NavigationControl. NavigationControl instructs BrowserEntity to navigate to the specified URL.

7. !track\_price

Description: Tracks the price of a product over time and sends notifications if the price changes.

Objects Involved:

Boundary: ProductTrackingBoundary

Control: ProductTrackingControl, ProductControl, NotificationControl

Entity: ProductEntity, TrackingHistoryEntity, NotificationEntity

Interaction:

ProductTrackingBoundary collects the product URL from the user.

ProductTrackingControl initiates price tracking and uses ProductControl to fetch the current price.

The current price is stored in TrackingHistoryEntity.

If there's a price change, NotificationControl sends an alert via NotificationEntity.

8. !check\_price

Description: Manually checks the current price of a product.

Objects Involved:

Boundary: ProductBoundary

Control: ProductControl

Entity: ProductEntity

Interaction: ProductBoundary collects the product information from the user, and ProductControl retrieves the current price using ProductEntity.

9. !check\_availability

Description: Checks the availability of a product or service on a specific date.

Objects Involved:

Boundary: AvailabilityBoundary

Control: AvailabilityControl

Entity: DateEntity

Interaction: AvailabilityBoundary collects the date and product/service details. AvailabilityControl checks the availability via DateEntity.

10. !stop\_tracking

Description: Stops tracking the price or availability of a product.

Objects Involved:

Boundary: StopTrackingBoundary

Control: StopTrackingControl

Entity: TrackingHistoryEntity

Interaction: StopTrackingBoundary collects the stop request from the user. StopTrackingControl stops the tracking and updates TrackingHistoryEntity.

#### 11. !receive\_notifications

Description: Sends notifications when there's a change in price or availability for tracked products/services.

Objects Involved:

Boundary: NotificationBoundary

Control: NotificationControl

Entity: NotificationEntity, TrackingHistoryEntity

Interaction: NotificationBoundary collects the user's preferences for receiving notifications. NotificationControl monitors for changes and uses NotificationEntity to send alerts when changes occur.

#### 12. !extract\_data

Description: Extracts the tracked product data and exports it to Excel or HTML format.

Objects Involved:

Boundary: DataExtractionBoundary

Control: DataExtractionControl

Entity: TrackingHistoryEntity

Utilities: ExcelUtils, HTMLUtils

Interaction: DataExtractionBoundary collects the user's request for data extraction. DataExtractionControl retrieves data from TrackingHistoryEntity and uses ExcelUtils or HTMLUtils to export the data to the desired format.

#### 13. !stop

Description: Stops the Discord bot from running.

Objects Involved:

Boundary: StopBoundary

Control: BotControl

Interaction: StopBoundary collects the stop command from the user and forwards it to BotControl, which gracefully stops the bot.

DiscordBotProject\_CISC699 - Project Overview

## Introduction

This project is a Discord bot designed to perform various tasks, including tracking product prices, checking availability, logging into websites, and exporting data.

The bot interacts with users via commands sent through Discord and responds based on the requested use case.

The project follows a clear structure, adhering to software engineering best practices, and separates the logic into Boundary, Control, and Entity objects to manage the flow of data and logic.

Scroll all the way down for project outline

## Objects and Their Roles

### Entity Objects

Entity objects represent the core business data and operations related to those entities. They store data and perform business logic related to that data. They do not interact directly with the user.

**ProductEntity:** Represents product information such as price and features. It handles product-related data (e.g., retrieving the current price).

**DateEntity:** Handles date and availability logic for booking or checking availability of services.

**AccountEntity:** Manages user login credentials for websites like BestBuy or eBay.

**TrackingHistoryEntity:** Stores and tracks historical data on product prices. Helps to compare past prices with current ones.

**BrowserEntity:** Manages the state of the browser (e.g., if the browser is running, whether it's in

incognito mode, etc.).

NotificationEntity: Handles user preferences for receiving notifications, such as when prices change or product availability is updated.

## Control Objects

Control objects are responsible for handling the logic of each use case. They interact with entity objects to manage data and handle business rules. Control objects execute the steps required to fulfill a use case.

HelpControl: Provides a list of commands available to the user.

ChatControl: Handles basic user interaction, such as greetings and responses to basic phrases like "hi" or "hello."

LoginControl: Manages the process of logging into a website, including retrieving login credentials from the database and passing them to the browser.

BrowserControl: Manages the launch and setup of the browser, including handling incognito mode and configuring the browser.

CloseBrowserControl: Handles the logic for closing the browser when requested by the user.

NavigationControl: Manages the process of navigating to a specific URL in the browser.

ProductTrackingControl: Manages the tracking of a product's price over time, scheduling regular price checks.

ProductControl: Checks the current price of a product and retrieves relevant product data.

AvailabilityControl: Handles checking the availability of a product or service based on user-provided dates.

StopTrackingControl: Stops the tracking process for a product or service.

NotificationControl: Monitors for changes in tracked products and sends notifications when a price or availability change occurs.

DataExtractionControl: Manages the extraction of tracking data, exporting it to Excel or HTML files.

BotControl: Manages the overall lifecycle of the Discord bot, including starting, stopping, and managing the registration of commands.

## Boundary Objects

Boundary objects serve as the bridge between the user (or external actor) and the system. They collect data from the user and forward it to the appropriate control object. Boundary objects are responsible for interacting with the actor but not for executing business logic.

HelpBoundary: Collects the user's help request and forwards it to HelpControl.

ChatBoundary: Receives chat commands from the user and forwards them to ChatControl.

LoginBoundary: Collects login credentials from the user and forwards them to LoginControl.

BrowserBoundary: Receives commands to launch the browser and forwards them to BrowserControl.

CloseBrowserBoundary: Receives the user's request to close the browser and forwards it to CloseBrowserControl.

NavigationBoundary: Receives URL input from the user and forwards it to NavigationControl.

ProductTrackingBoundary: Collects the user's request to track a product and forwards it to ProductTrackingControl.

ProductBoundary: Receives the user's request to check a product price and forwards it to ProductControl.

AvailabilityBoundary: Collects the user's availability check request and forwards it to AvailabilityControl.

StopTrackingBoundary: Receives the user's request to stop tracking a product and forwards it to StopTrackingControl.

NotificationBoundary: Collects user preferences for receiving notifications and forwards them to NotificationControl.

DataExtractionBoundary: Collects the user's request to export data and forwards it to DataExtractionControl.

StopBoundary: Receives the request to stop the bot and forwards it to BotControl.

## Capabilities

Here's what the bot can do:

### 1. !project\_help

Description: Provides a list of available commands the user can issue.

Objects Involved:

Boundary: HelpBoundary

Control: HelpControl

Interaction: HelpBoundary collects the user's help request and forwards it to HelpControl, which responds with the list of commands.

### 2. !chat\_with\_bot

Description: Responds to simple greetings (e.g., "hi", "hello") and provides a welcome message.

Objects Involved:

Boundary: ChatBoundary

Control: ChatControl

Interaction: ChatBoundary collects chat input and forwards it to ChatControl, which sends back a predefined response.

### 3. !login\_to\_website

Description: Logs into a website using stored credentials (e.g., BestBuy).

Objects Involved:

Boundary: LoginBoundary

Control: LoginControl, BrowserControl, NavigationControl

Entity: AccountEntity

Interaction:

LoginBoundary collects login credentials and forwards them to LoginControl.

LoginControl works with BrowserControl to launch the browser.

NavigationControl navigates to the website's login page.

AccountEntity retrieves the stored credentials from the database and logs the user in.

#### 4. !launch\_browser

Description: Launches the browser, optionally in incognito mode.

Objects Involved:

Boundary: BrowserBoundary

Control: BrowserControl

Entity: BrowserEntity

Interaction: BrowserBoundary collects the user's request to launch the browser and sends it to BrowserControl. BrowserControl uses BrowserEntity to configure and launch the browser.

#### 5. !close\_browser

Description: Closes the currently open browser session.

Objects Involved:

Boundary: CloseBrowserBoundary

Control: CloseBrowserControl

Entity: BrowserEntity

Interaction: CloseBrowserBoundary forwards the user's request to CloseBrowserControl, which then tells BrowserEntity to close the browser session.

#### 6. !navigate\_to\_website

Description: Navigates to a specific website URL in the browser.

Objects Involved:

Boundary: NavigationBoundary

Control: NavigationControl

Entity: BrowserEntity

Interaction: NavigationBoundary collects the URL input from the user and forwards it to NavigationControl. NavigationControl instructs BrowserEntity to navigate to the specified URL.

#### 7. !track\_price

Description: Tracks the price of a product over time and sends notifications if the price changes.

Objects Involved:

Boundary: ProductTrackingBoundary

Control: ProductTrackingControl, ProductControl, NotificationControl

Entity: ProductEntity, TrackingHistoryEntity, NotificationEntity

Interaction:

ProductTrackingBoundary collects the product URL from the user.

ProductTrackingControl initiates price tracking and uses ProductControl to fetch the current price.

The current price is stored in TrackingHistoryEntity.

If there's a price change, NotificationControl sends an alert via NotificationEntity.

8. !check\_price

Description: Manually checks the current price of a product.

Objects Involved:

Boundary: ProductBoundary

Control: ProductControl

Entity: ProductEntity

Interaction: ProductBoundary collects the product information from the user, and ProductControl retrieves the current price using ProductEntity.

9. !check\_availability

Description: Checks the availability of a product or service on a specific date.

Objects Involved:

Boundary: AvailabilityBoundary

Control: AvailabilityControl

Entity: DateEntity

Interaction: AvailabilityBoundary collects the date and product/service details. AvailabilityControl checks the availability via DateEntity.

10. !stop\_tracking

Description: Stops tracking the price or availability of a product.

Objects Involved:

Boundary: StopTrackingBoundary

Control: StopTrackingControl

Entity: TrackingHistoryEntity

Interaction: StopTrackingBoundary collects the stop request from the user. StopTrackingControl stops the tracking and updates TrackingHistoryEntity.

#### 11. !receive\_notifications

Description: Sends notifications when there's a change in price or availability for tracked products/services.

Objects Involved:

Boundary: NotificationBoundary

Control: NotificationControl

Entity: NotificationEntity, TrackingHistoryEntity

Interaction: NotificationBoundary collects the user's preferences for receiving notifications. NotificationControl monitors for changes and uses NotificationEntity to send alerts when changes occur.

#### 12. !extract\_data

Description: Extracts the tracked product data and exports it to Excel or HTML format.

Objects Involved:

Boundary: DataExtractionBoundary

Control: DataExtractionControl

Entity: TrackingHistoryEntity

Utilities: ExcelUtils, HTMLUtils

Interaction: DataExtractionBoundary collects the user's request for data extraction. DataExtractionControl retrieves data from TrackingHistoryEntity and uses ExcelUtils or HTMLUtils to export the data to the desired format.

### 13. !stop

Description: Stops the Discord bot from running.

Objects Involved:

Boundary: StopBoundary

Control: BotControl

Interaction: StopBoundary collects the stop command from the user and forwards it to BotControl, which gracefully stops the bot.

## DiscordBotProject\_CISC699 - Project Overview

### Introduction

This project is a Discord bot designed to perform various tasks, including tracking product prices, checking availability, logging into websites, and exporting data.

The bot interacts with users via commands sent through Discord and responds based on the requested use case.

The project follows a clear structure, adhering to software engineering best practices, and separates the logic into Boundary, Control, and Entity objects to manage the flow of data and logic.

Scroll all the way down for project outline

### Objects and Their Roles

#### Entity Objects

Entity objects represent the core business data and operations related to those entities. They store data and perform business logic related to that data. They do not interact directly with the user.

**ProductEntity:** Represents product information such as price and features. It handles product-related data (e.g., retrieving the current price).

**DateEntity:** Handles date and availability logic for booking or checking availability of services.

**AccountEntity:** Manages user login credentials for websites like BestBuy or eBay.

**TrackingHistoryEntity:** Stores and tracks historical data on product prices. Helps to compare past prices with current ones.

BrowserEntity: Manages the state of the browser (e.g., if the browser is running, whether it's in incognito mode, etc.).

NotificationEntity: Handles user preferences for receiving notifications, such as when prices change or product availability is updated.

## Control Objects

Control objects are responsible for handling the logic of each use case. They interact with entity objects to manage data and handle business rules. Control objects execute the steps required to fulfill a use case.

HelpControl: Provides a list of commands available to the user.

ChatControl: Handles basic user interaction, such as greetings and responses to basic phrases like "hi" or "hello."

LoginControl: Manages the process of logging into a website, including retrieving login credentials from the database and passing them to the browser.

BrowserControl: Manages the launch and setup of the browser, including handling incognito mode and configuring the browser.

CloseBrowserControl: Handles the logic for closing the browser when requested by the user.

NavigationControl: Manages the process of navigating to a specific URL in the browser.

ProductTrackingControl: Manages the tracking of a product's price over time, scheduling regular

price checks.

**ProductControl:** Checks the current price of a product and retrieves relevant product data.

**AvailabilityControl:** Handles checking the availability of a product or service based on user-provided dates.

**StopTrackingControl:** Stops the tracking process for a product or service.

**NotificationControl:** Monitors for changes in tracked products and sends notifications when a price or availability change occurs.

**DataExtractionControl:** Manages the extraction of tracking data, exporting it to Excel or HTML files.

**BotControl:** Manages the overall lifecycle of the Discord bot, including starting, stopping, and managing the registration of commands.

## Boundary Objects

Boundary objects serve as the bridge between the user (or external actor) and the system. They collect data from the user and forward it to the appropriate control object. Boundary objects are responsible for interacting with the actor but not for executing business logic.

**HelpBoundary:** Collects the user's help request and forwards it to HelpControl.

**ChatBoundary:** Receives chat commands from the user and forwards them to ChatControl.

**LoginBoundary:** Collects login credentials from the user and forwards them to LoginControl.

BrowserBoundary: Receives commands to launch the browser and forwards them to BrowserControl.

CloseBrowserBoundary: Receives the user's request to close the browser and forwards it to CloseBrowserControl.

NavigationBoundary: Receives URL input from the user and forwards it to NavigationControl.

ProductTrackingBoundary: Collects the user's request to track a product and forwards it to ProductTrackingControl.

ProductBoundary: Receives the user's request to check a product price and forwards it to ProductControl.

AvailabilityBoundary: Collects the user's availability check request and forwards it to AvailabilityControl.

StopTrackingBoundary: Receives the user's request to stop tracking a product and forwards it to StopTrackingControl.

NotificationBoundary: Collects user preferences for receiving notifications and forwards them to NotificationControl.

DataExtractionBoundary: Collects the user's request to export data and forwards it to DataExtractionControl.

StopBoundary: Receives the request to stop the bot and forwards it to BotControl.

## Capabilities

Here's what the bot can do:

### 1. !project\_help

Description: Provides a list of available commands the user can issue.

Objects Involved:

Boundary: HelpBoundary

Control: HelpControl

Interaction: HelpBoundary collects the user's help request and forwards it to HelpControl, which responds with the list of commands.

### 2. !chat\_with\_bot

Description: Responds to simple greetings (e.g., "hi", "hello") and provides a welcome message.

Objects Involved:

Boundary: ChatBoundary

Control: ChatControl

Interaction: ChatBoundary collects chat input and forwards it to ChatControl, which sends back a predefined response.

### 3. !login\_to\_website

Description: Logs into a website using stored credentials (e.g., BestBuy).

Objects Involved:

Boundary: LoginBoundary

Control: LoginControl, BrowserControl, NavigationControl

Entity: AccountEntity

Interaction:

LoginBoundary collects login credentials and forwards them to LoginControl.

LoginControl works with BrowserControl to launch the browser.

NavigationControl navigates to the website's login page.

AccountEntity retrieves the stored credentials from the database and logs the user in.

#### 4. !launch\_browser

Description: Launches the browser, optionally in incognito mode.

Objects Involved:

Boundary: BrowserBoundary

Control: BrowserControl

Entity: BrowserEntity

Interaction: BrowserBoundary collects the user's request to launch the browser and sends it to BrowserControl. BrowserControl uses BrowserEntity to configure and launch the browser.

#### 5. !close\_browser

Description: Closes the currently open browser session.

Objects Involved:

Boundary: CloseBrowserBoundary

Control: CloseBrowserControl

Entity: BrowserEntity

Interaction: CloseBrowserBoundary forwards the user's request to CloseBrowserControl, which then tells BrowserEntity to close the browser session.

#### 6. !navigate\_to\_website

Description: Navigates to a specific website URL in the browser.

Objects Involved:

Boundary: NavigationBoundary

Control: NavigationControl

Entity: BrowserEntity

Interaction: NavigationBoundary collects the URL input from the user and forwards it to

NavigationControl. NavigationControl instructs BrowserEntity to navigate to the specified URL.

## 7. !track\_price

Description: Tracks the price of a product over time and sends notifications if the price changes.

Objects Involved:

Boundary: ProductTrackingBoundary

Control: ProductTrackingControl, ProductControl, NotificationControl

Entity: ProductEntity, TrackingHistoryEntity, NotificationEntity

Interaction:

ProductTrackingBoundary collects the product URL from the user.

ProductTrackingControl initiates price tracking and uses ProductControl to fetch the current price.

The current price is stored in TrackingHistoryEntity.

If there's a price change, NotificationControl sends an alert via NotificationEntity.

## 8. !check\_price

Description: Manually checks the current price of a product.

Objects Involved:

Boundary: ProductBoundary

Control: ProductControl

Entity: ProductEntity

Interaction: ProductBoundary collects the product information from the user, and ProductControl retrieves the current price using ProductEntity.

## 9. !check\_availability

Description: Checks the availability of a product or service on a specific date.

Objects Involved:

Boundary: AvailabilityBoundary

Control: AvailabilityControl

Entity: DateEntity

Interaction: AvailabilityBoundary collects the date and product/service details. AvailabilityControl

checks the availability via DateEntity.

#### 10. !stop\_tracking

Description: Stops tracking the price or availability of a product.

Objects Involved:

Boundary: StopTrackingBoundary

Control: StopTrackingControl

Entity: TrackingHistoryEntity

Interaction: StopTrackingBoundary collects the stop request from the user. StopTrackingControl stops the tracking and updates TrackingHistoryEntity.

#### 11. !receive\_notifications

Description: Sends notifications when there's a change in price or availability for tracked products/services.

Objects Involved:

Boundary: NotificationBoundary

Control: NotificationControl

Entity: NotificationEntity, TrackingHistoryEntity

Interaction: NotificationBoundary collects the user's preferences for receiving notifications. NotificationControl monitors for changes and uses NotificationEntity to send alerts when changes occur.

#### 12. !extract\_data

Description: Extracts the tracked product data and exports it to Excel or HTML format.

Objects Involved:

Boundary: DataExtractionBoundary

Control: DataExtractionControl

Entity: TrackingHistoryEntity

Utilities: ExcelUtils, HTMLUtils

Interaction: DataExtractionBoundary collects the user's request for data extraction.

DataExtractionControl retrieves data from TrackingHistoryEntity and uses ExcelUtils or HTMLUtils to export the data to the desired format.

13. !stop

Description: Stops the Discord bot from running.

Objects Involved:

Boundary: StopBoundary

Control: BotControl

Interaction: StopBoundary collects the stop command from the user and forwards it to BotControl, which gracefully stops the bot.
